INTRODUCTION

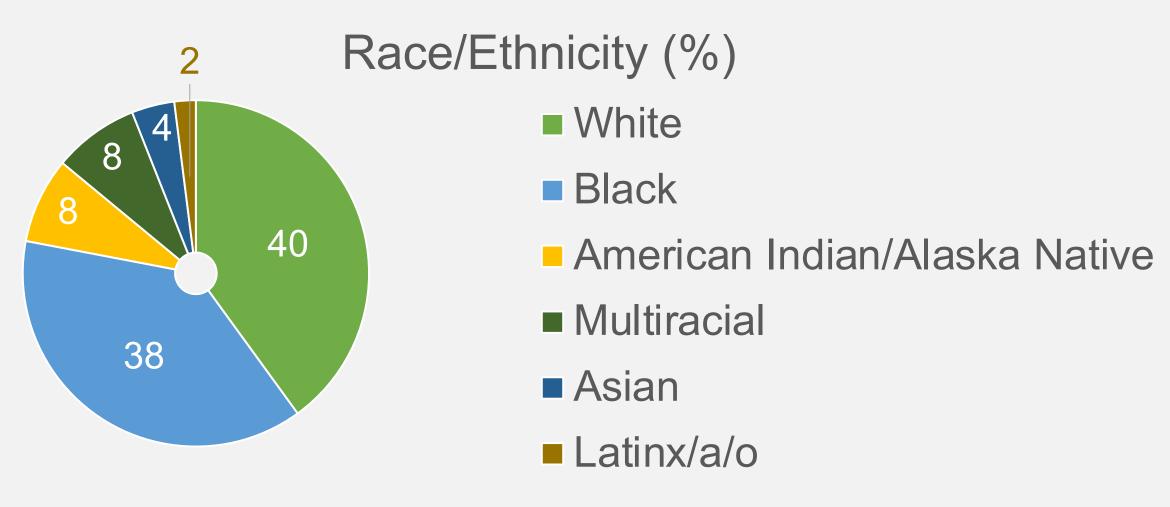

- Young adults exhibit high rates of concurrent alcohol and cannabis use¹⁻²
- Concurrent use is associated with more negative alcohol-related consequences²
- Positive psychological interventions (PPIs) may function as a harm reduction approach to reduce alcohol-related consequences³⁻⁸
- Aim: To examine the effects of two PPIs, savoring^{6,9-12} and Three Good Things (TGT)^{8,9,13} on weekly alcohol use frequency and alcohol-related consequences

METHODS

- Secondary analysis of data from a pilot study of PPIs in young adults¹⁴ recruited in June 2021
- Inclusion: 18-25 years old, used cannabis/alcohol in the prior month, text messaging access
- At baseline (B), 61 participants were randomized: savoring, TGT, or control
 - Over 14 days, daily self-report surveys were sent
 - 15 days after B, follow-up surveys (F) were sent to 50 participants

| Variables | Mea | an (SD) / % (| (n) |
|-----------|------|---------------|-----|
| Age | 22.7 | '2 years (1.6 | 33) |
| Women | 28% | 5 (14) | |
| Men | 72% | b (36) | |
| Students | 74% | b (37) | |
| Employed | 78% | b (39) | |

Participants who savored showed a large decrease in their alcohol consequences

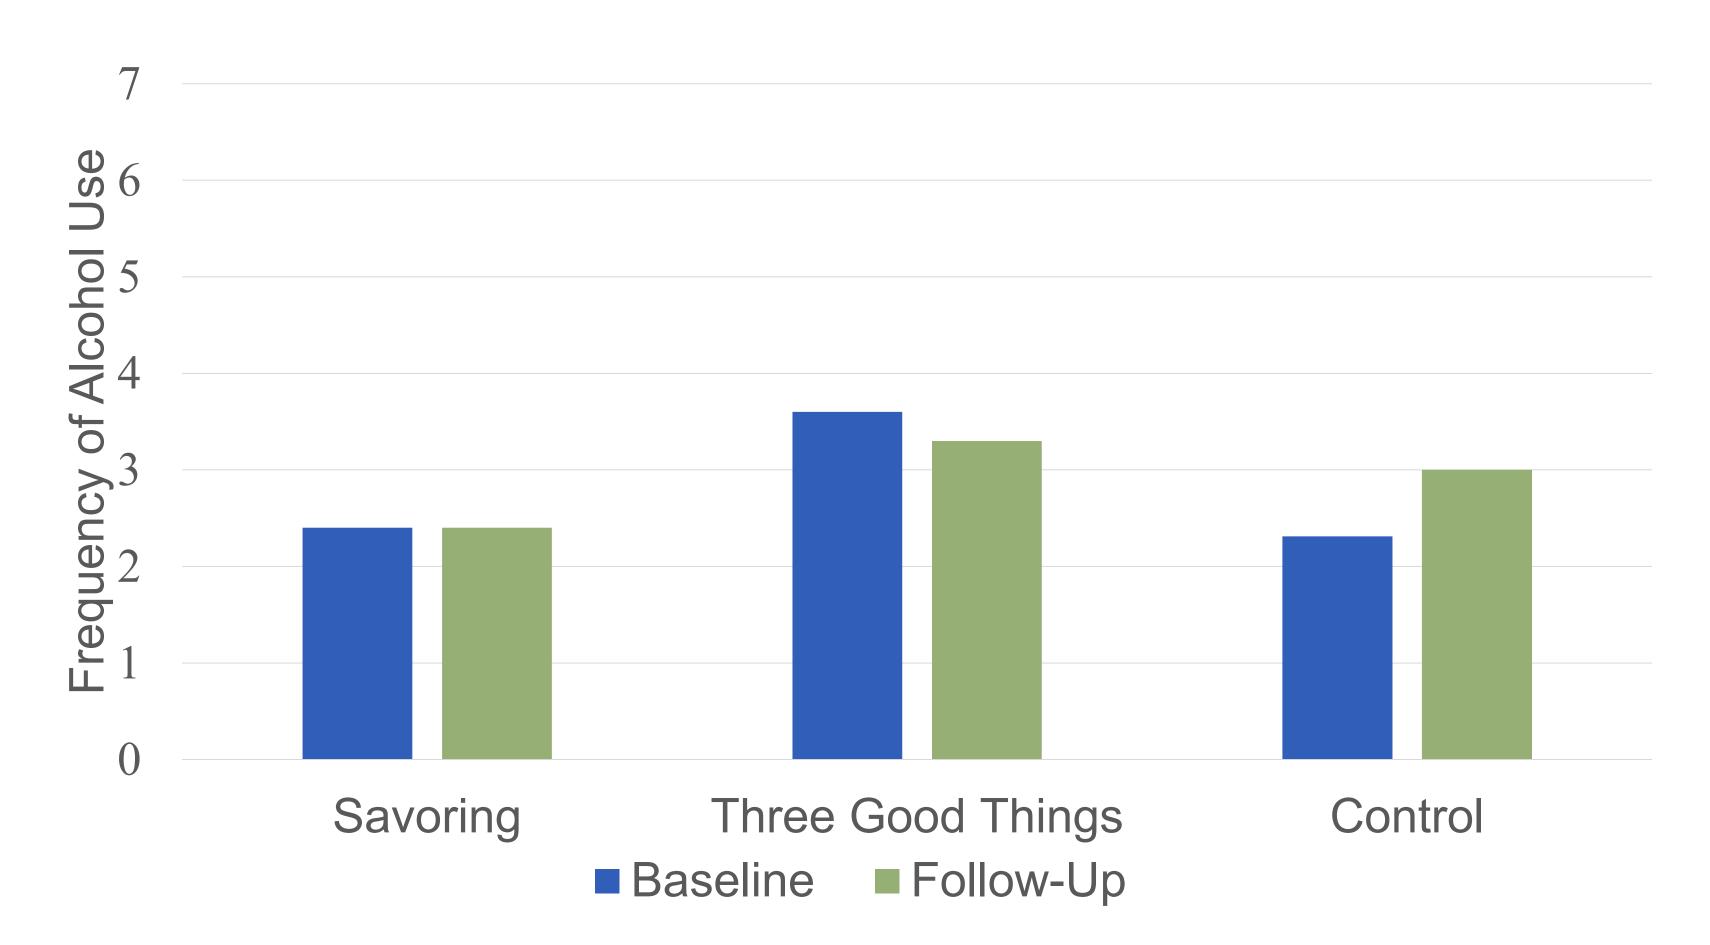

Figure 1. Changes in frequency of alcohol use by intervention condition

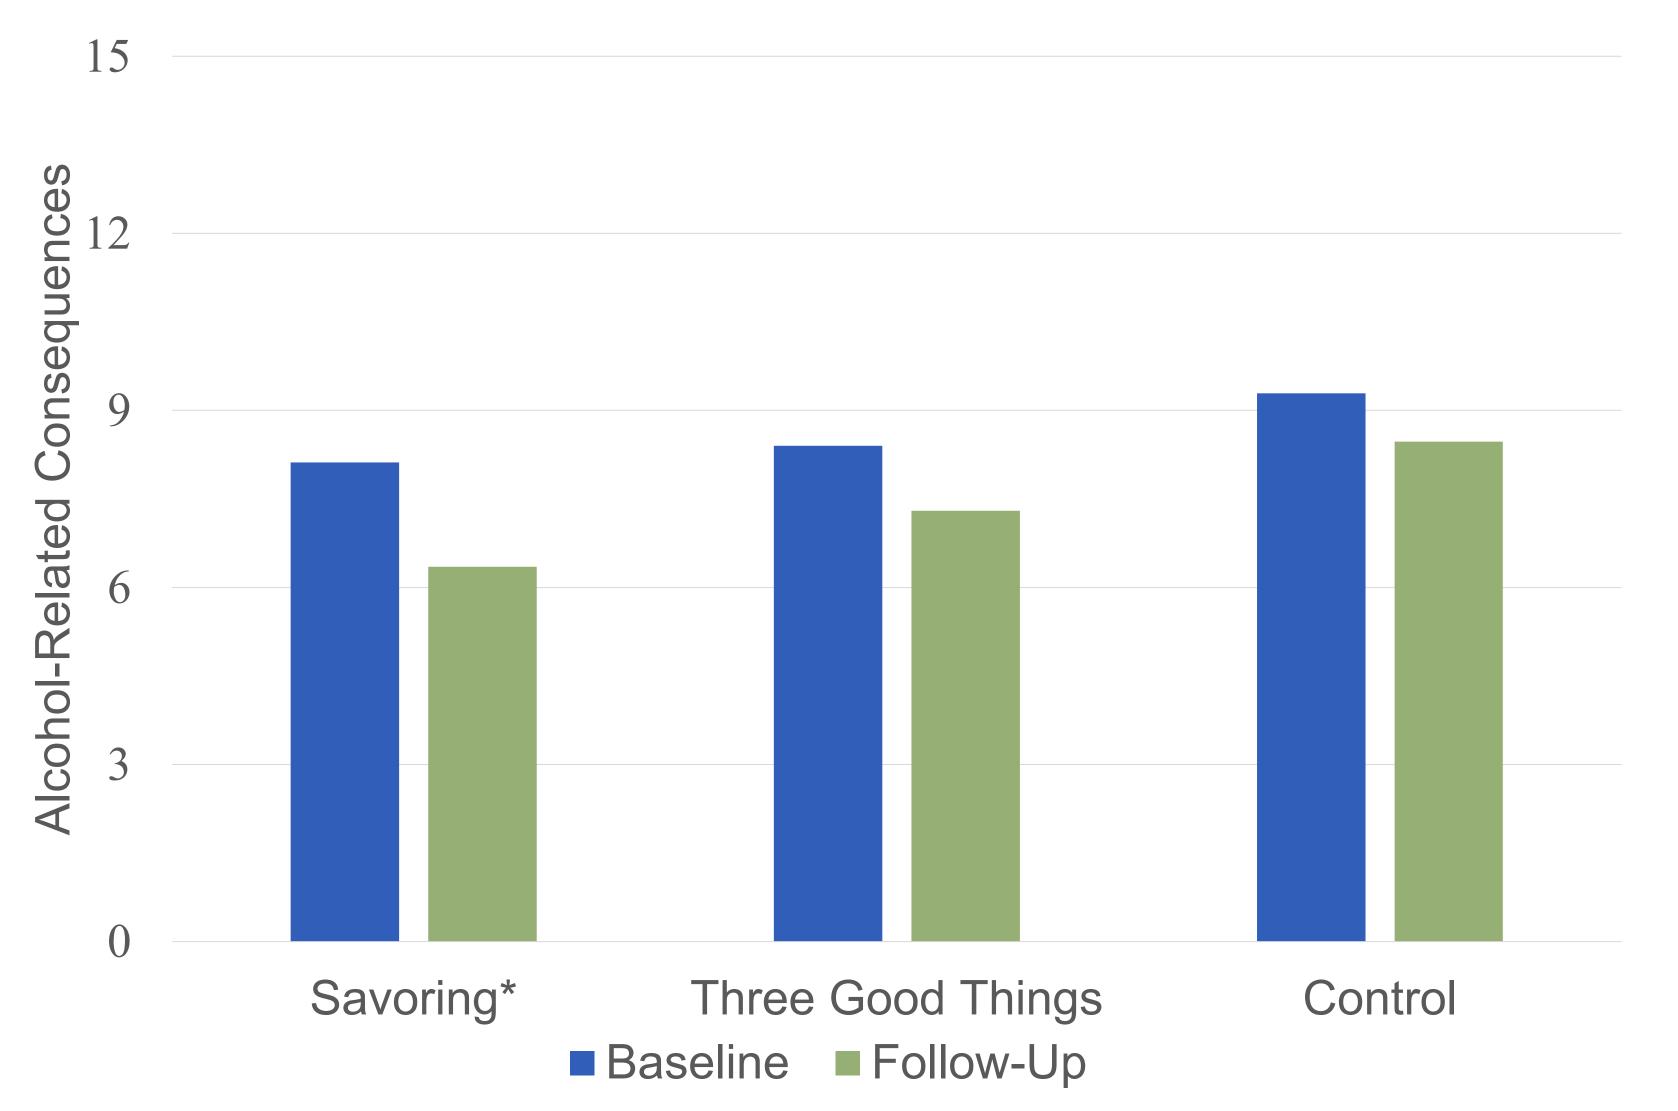

Figure 2. Changes in alcohol-related consequences by intervention condition

trinh@uri.edu @CatherineDTrinh

RESULTS

- Savoring: Large decrease in alcohol-related consequences (t[16] = 2.28, p = .04, $g_{av} = 0.54$); no change in alcohol use frequency
- TGT: Nonsignificant decreases in alcohol-related consequences and alcohol use frequency

| | Savoring | 8.12 | 4.89 | 6.35 | 5.96 | -1.77 | 3.19 | 16 | 2.28 | .04 | .85 | 0.54 |
| | TGT | 8.40 | 6.57 | 7.30 | 7.18 | -1.10 | 2.28 | 9 | 1.52 | .16 | .95 | 0.46 |
| | Control | 9.29 | 6.41 | 8.47 | 5.71 | -0.82 | 4.42 | 16 | 0.77 | .45 | .74 | 0.18 |

CONCLUSION

- Call for treatments to increase positive feelings⁵
- Savoring can be administered remotely to facilitate accessibility^{13,15} at minimal cost¹⁶
- Savoring may appeal to young adults whose goals may not include abstinence¹⁷
- Participants may prefer savoring to a "typical harm reduction intervention"11
- Initial support for a savoring intervention to target alcohol-related consequences
- Limitations: Two-week follow-up period, only alcohol and cannabis use
- Future Directions: Examine PPIs in larger trials and over an extended follow-up period
